

ABSTRACT OF THE DISCLOSURE

A tie for joining to a shirt collar includes a linearly extending strip which is arranged between a shaped clasp cover-piece having a vertical cavity and a clasp shaped as an overturned U and able to be contained partly inside the cavity so as to fix inside it the top end of the strip between the clasp and the cavity. The clasp body is substantially cylindrical and has, emerging from it perpendicularly, two or more studs which pass through a corresponding number of holes formed on the top end of the strip. The studs project from the holes so as to penetrate into a corresponding number of openings formed on a clip-like sleeve which is open on one side and shaped so as to contain in a complementary manner the clasp supporting thereon the top end of the strip.
